miss it, miss out.

Designing for Six-sigma quality levels with
Behavioral Modeling

Andreas Vlahinos, Ph.D., Principal,
Advanced Engineering Solutions, LLC

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Outline

What it's NOT

- A flashy sales demo of Behavioral Modeling
- A complex statistical analysis presentation

What it is

- A status of the current design and simulation state in the product development process
- Overview of the tools and techniques for traditional and robust design (DOE, PDS, BMX, Six-sigma, design synthesis, etc)
- An overview of the "Engineering Quality into the Design"
- Implementation examples of Behavioral Modeling
- Overview of the implementation challenges and solution strategies to overcome them

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Acknowledgments

The author would like to recognize his colleagues at:

NSF Engineering Design Program

NAE / NASA Study on product development

DOE Office of Transportation Technologies (DFV)

NREL Center of Transportation Technologies & Systems

FORD Motor Company (CAE Methods Development Group)

NASA Ames (Integrated Systems Technologies Branch)

for their financial support and technical contributions and
source of information

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

PTCuser®

Contradicting Design Requirements

- Cost
- Performance & safety
- Quality
- Time to market & short life cycle
- Environmental impacts
- Wow Aesthetics (creating waves of lust for the product, I got to have it ...)
- Major Changes in Industry's Business Model

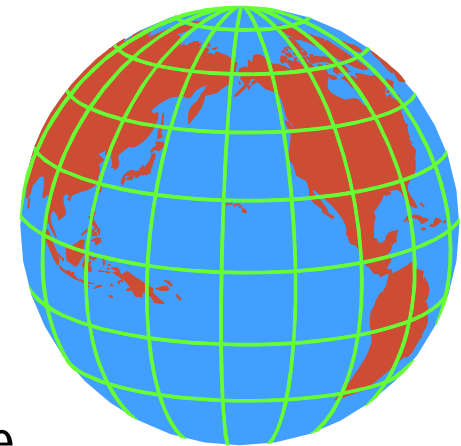

5

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Changes in Automotive Industry's Business Model

- Cycle development time from concept to production is being compressed significantly
 - 1992: 60 months
 - 1996: 48 months
 - 2000: 18 months
- Vehicle designs are tailored to focused markets
- Vehicles are being manufactured more on a global scale
- Vehicles designed increasingly through multiple engineering sites around the world
- Need for enabling companies throughout the supply chain and extended enterprise to share information through a web-centric visualization approach

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Elements in Product Development Process

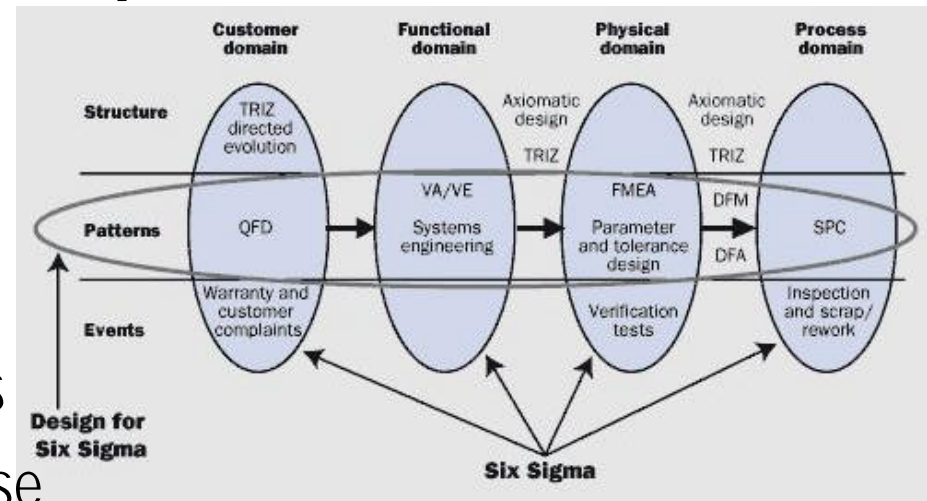

Concept Development

Product Design

Attribute Refinement

Design information systems

- Knowledge capture and reuse
- Documentation of rationale for the design
- Self designed parts
- Collaborative design

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

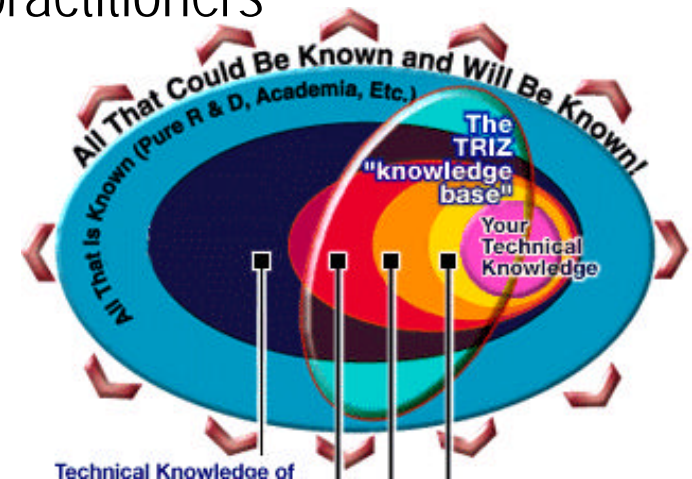

Concept Development

Typical Elements Today

- Conceptual design generation is highly iterative & mostly manual
- Inconsistent use of heuristics, rules of thumb
- Success requires experienced skilled practitioners

Possible Today

- TRIZ, Functional Diagrams
- Material-process-section selector
- Topology optimization
- Rapid Prototyping

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Elements of Product Design

- Rapid generation of design alternatives (CAD, tolerance / variational analysis)
- Process is CAD centric and highly iterative
- Easy evaluation of candidate designs (FEA, CFD, Multi-physics)
- Rigorous evaluation and comparison of design alternatives
- Nonsystematic decision making, many design decisions are based on aggregation of preferences
- Limited reuse of product designs
- Success requires experienced skilled practitioners

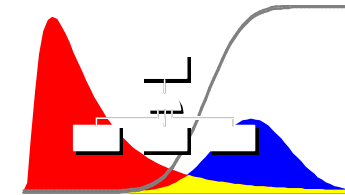

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Attribute Refinement

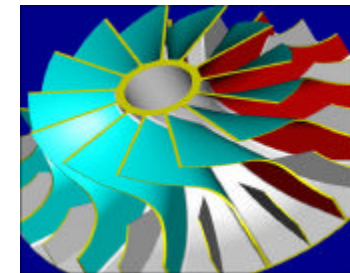

Typical Elements

- More than half of attributes require experimental refinement
- Physical prototypes required

Possible Today

- Sensitivity and optimization studies of designs
- Robust Designs (DOE, BMX, PDS, Six-sigma)
- Reliability based optimization

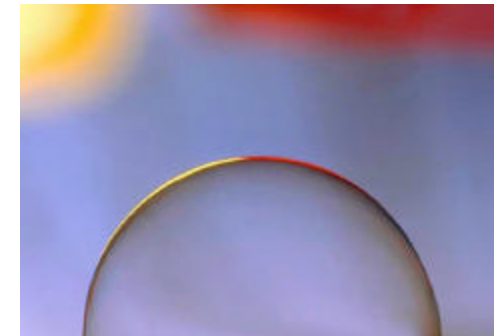

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Expectations of CAD & CAE implementation

- Reduced Prototypes and testing
- Better integration with suppliers
- Increased reuse of existing designs
- Early prediction of product attributes
- More program predictable results
- Knowledge capture and reuse

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Results of CAD & CAE implementation

- Sporadic demonstrations not sustained benefits
- Best reduction in design and development cost 75% with 2x product complexity
- Typical reduction in design and development cost 5-10% with 2-3x product complexity
- Still tradition and experience govern the design choices

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Outline

- A status of the current design and simulation state in the product development process
- Overview of the tools and techniques for traditional and robust design (DOE, PDS, BMX, Six-sigma, design synthesis, etc)
- An overview of the “Engineering Quality into the Design”
- Implementation examples of Behavioral Modeling
- Overview of the implementation challenges and solution strategies to overcome them

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

PTCuser®

Quality - Robust Design

Definition of Robust Design:

Deliver customer expectations at profitable cost regardless of:

- customer usage
- variation in manufacturing
- variation in supplier
- variation in distribution, delivery & installation
- degradation over product life

Goals of Robust Design (shift and squeeze)

- Shift performance mean to the target value
- Reduce product's performance variability

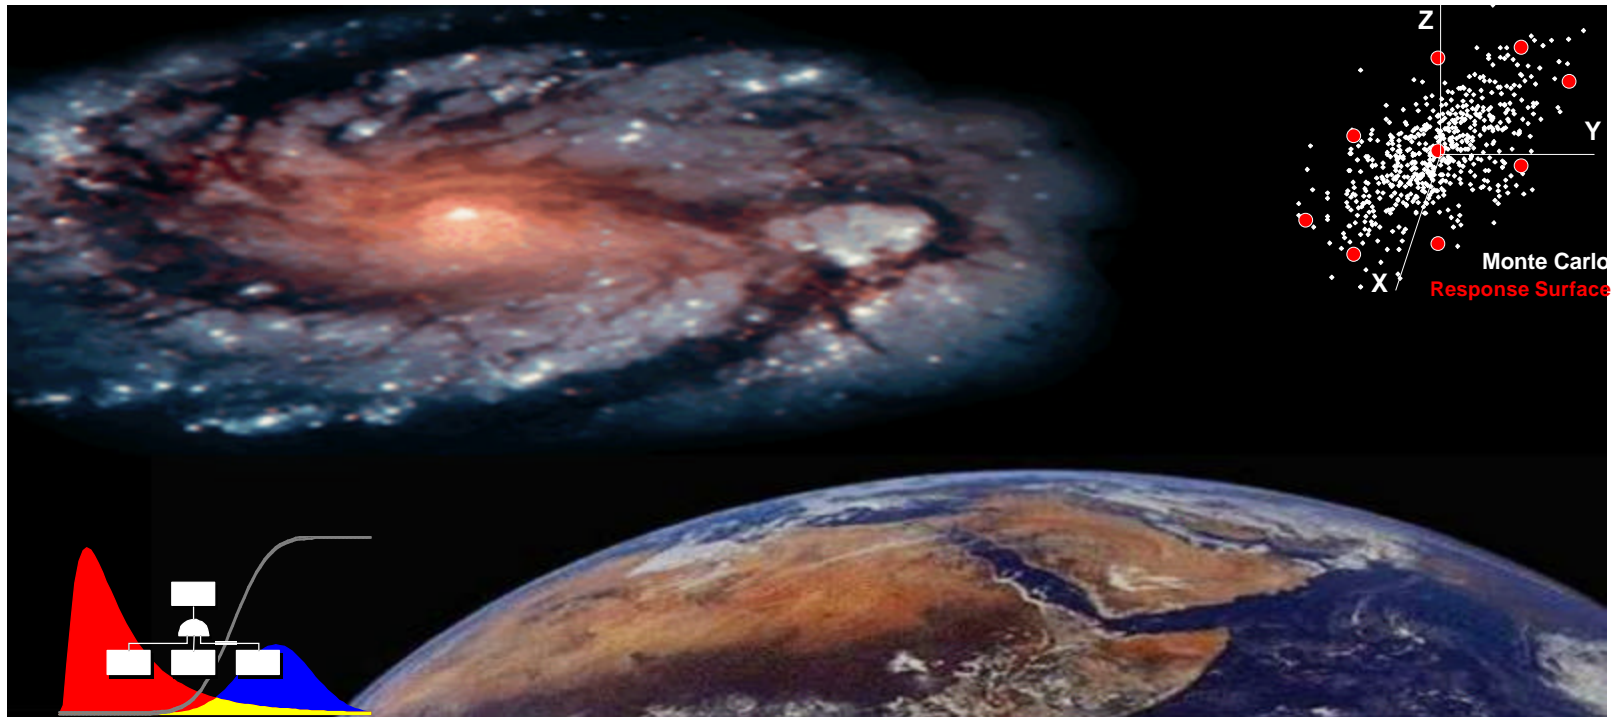

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Randomness and Scatter is a part of reality Everywhere

**Probabilistic Design Techniques bring simulation closer
to REALITY!**

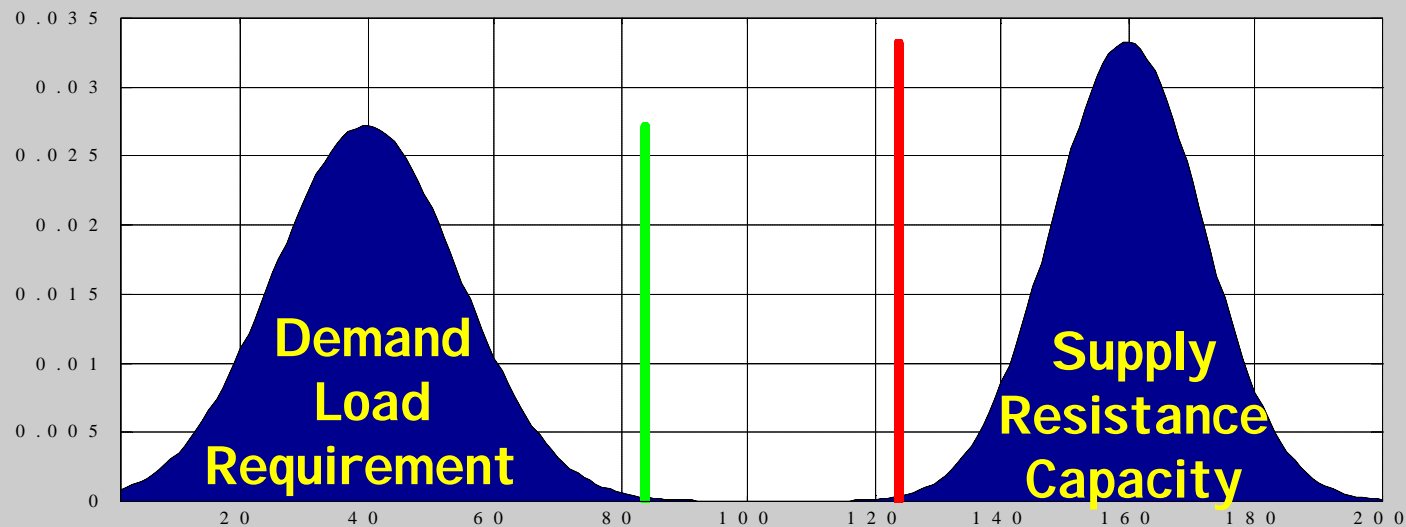

15

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Traditional Deterministic Approach

- Accounts for uncertainties through the use of empirical Safety factors:
 - Are derived based on past experience
 - Do not guarantee safety or satisfactory performance
 - Do not provide sufficient information to achieve optimal use of available resources

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Statistical Design Performance Simulation

*" You 've got to be passionate lunatics about the **quality** issue ..."*

Jack Welch

*" Product quality requires managerial, technological and **statistical** concepts throughout all the major functions of the organization ..."*

Josheph M. Juran

Variation (thickness, properties, surface finish, loads, etc.) is ...
THE ENEMY

DOE, Six Sigma, Statistical FEA, Behavioral Modeling
...
THE DEFENCE

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Tools for Robust Design

Design Of Experiments (DOE)

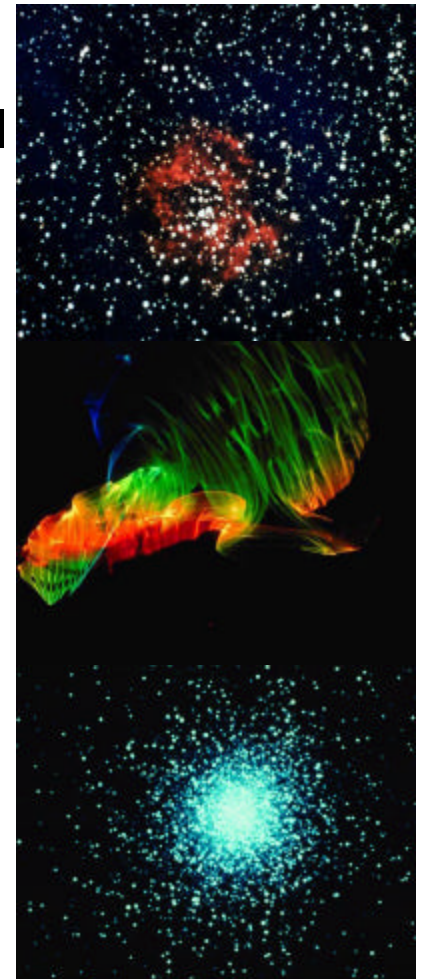

- Exploits nonlinearities and interactions between noise & control parameters to reduce product performance variability
- full factorial, fractional factorial, Monte-Carlo, LHC

Response Surface Methods

- Central Composite Design
- Box-Behnken Design

6-sigma design (Statistical Performance)

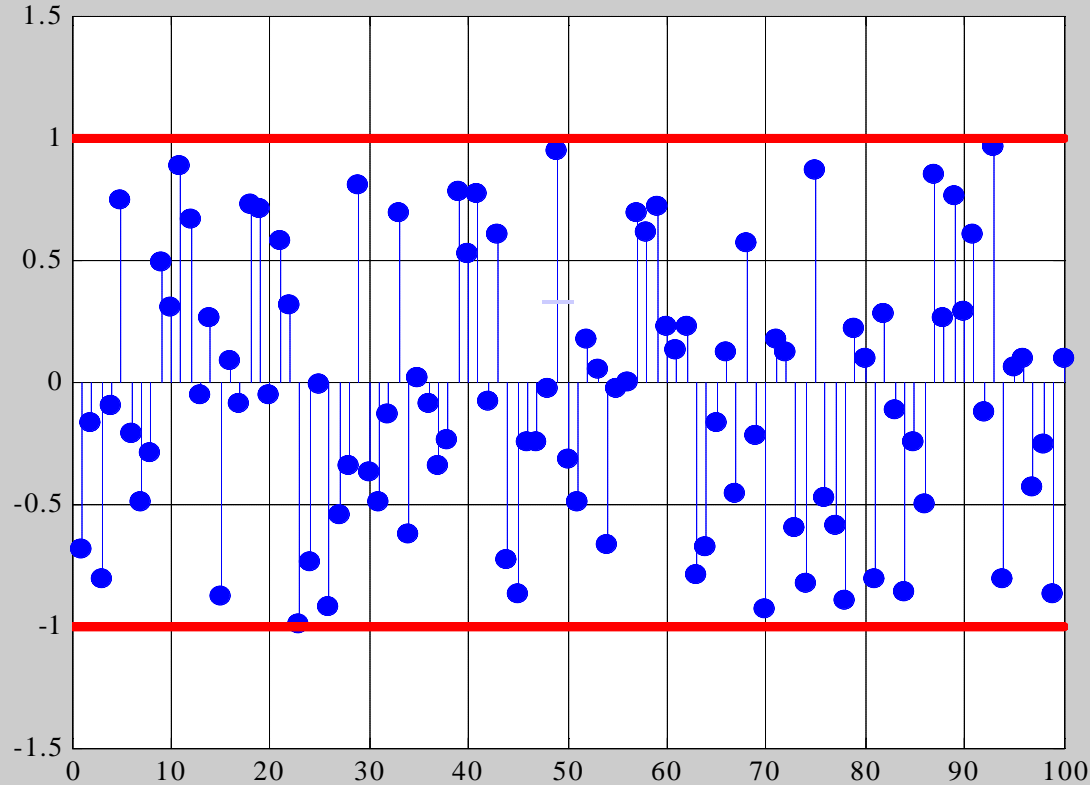

- Identifying & qualifying causes of variation
- Centering performance on specification target
- Achieving Six Sigma level robustness on the key product performance characteristics with respect to the quantified variation

Elements of Quality Process: The alphabet soup

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

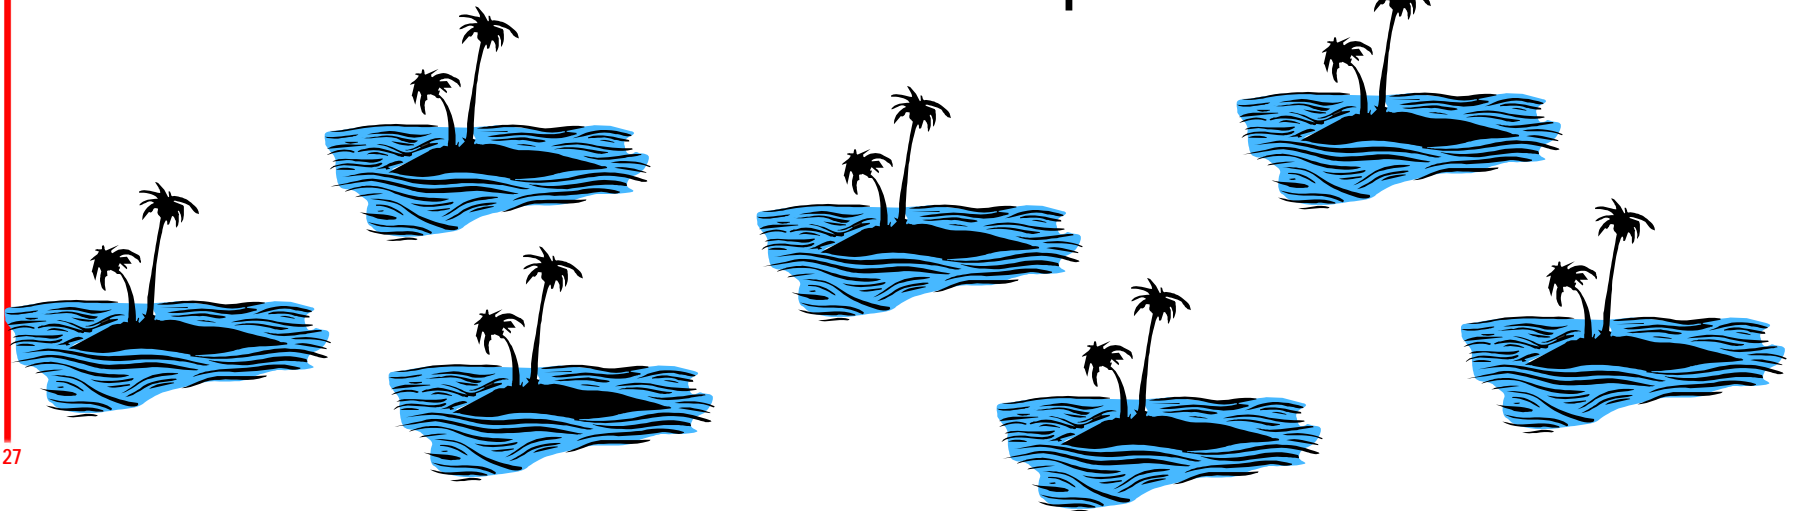

PTCuser®

Elements of Quality Management Process

Although all the elements of quality management process are closely connected they remain apart because they have been developed independently from each other

Integration of these tools is critical to the organization and necessary for successful federation and robust optimization efforts

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Identifying Noise & Control Parameters

Noise parameters:

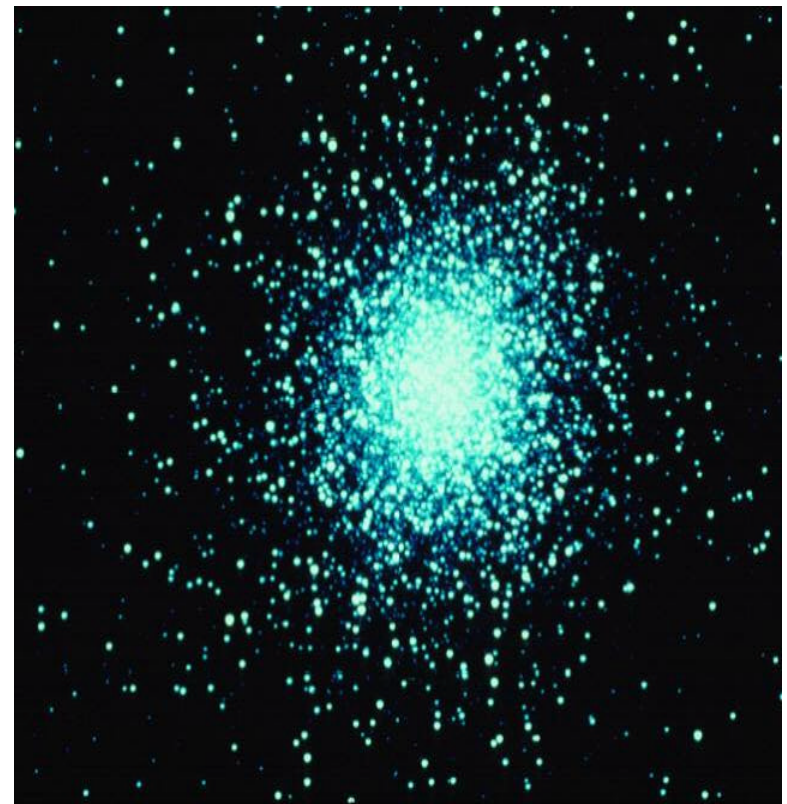

Factors that are beyond the control of the designer

- material property variability
- manufacturing process limitations
- environment temperature & humidity
- component degradation with time
- ...

Control Parameters:

Factors that the designer can control

- geometric design variables
- material selections
- design configurations
- manufacturing process settings

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Implementation Examples of Behavioral Modeling

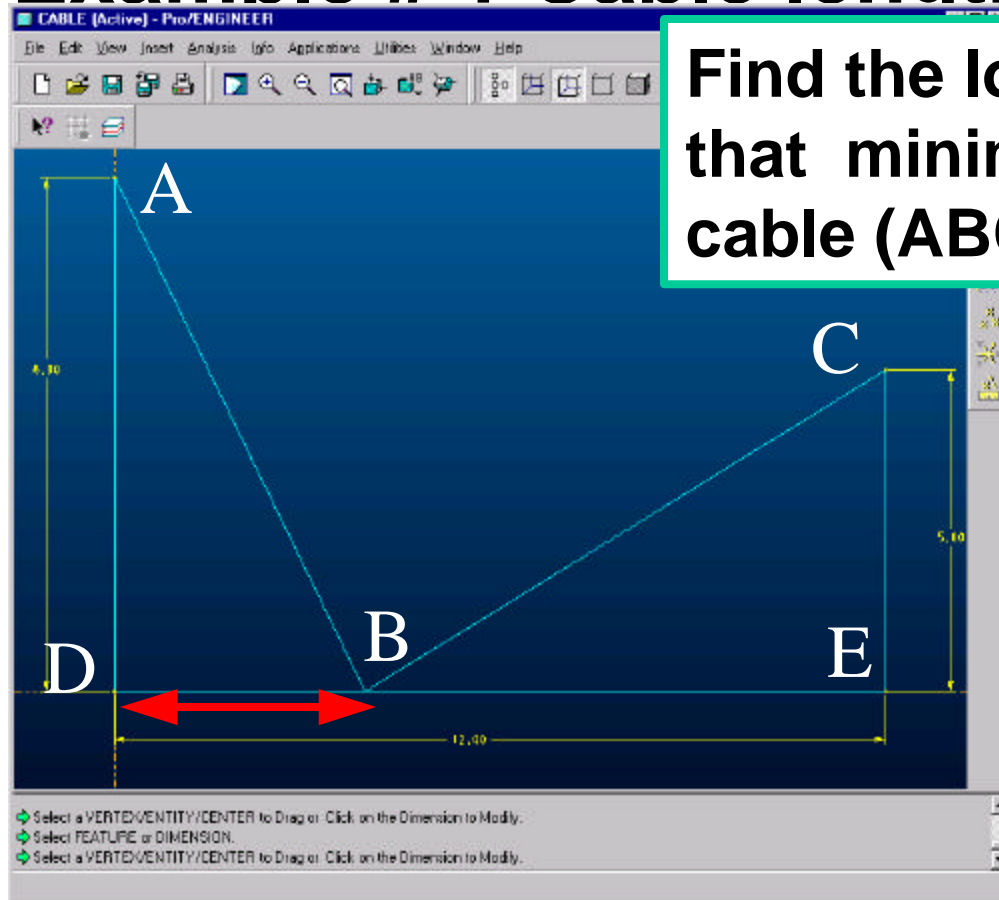

1. Cable length optimization
2. Requirement Driven design
3. Inspection of thickness requirements in castings
4. Packaging optimization of metal stamped parts to minimize scrap
5. Robust container design
6. Reliability based design within Pro/Engineer

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Example # 1 Cable length minimization

Find the location (distance DB) that minimizes the length of the cable (ABC).

31

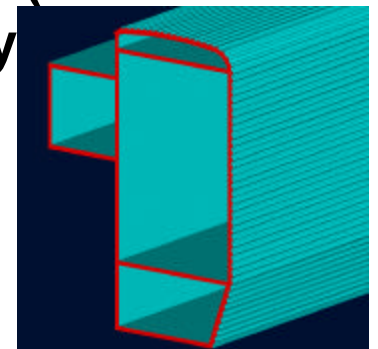

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Example # 2 Behavioral Modeling of the Section

- All sections have the same moment of Inertia
- Find the one that minimizes the cross sectional area (Min Weight) and meets all the manufacturing and stability requirements
- Not a dimension driven CAD model
- Requirement driven design (I_{req})

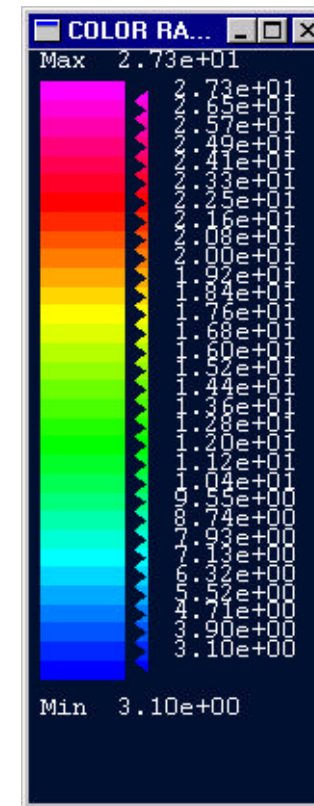

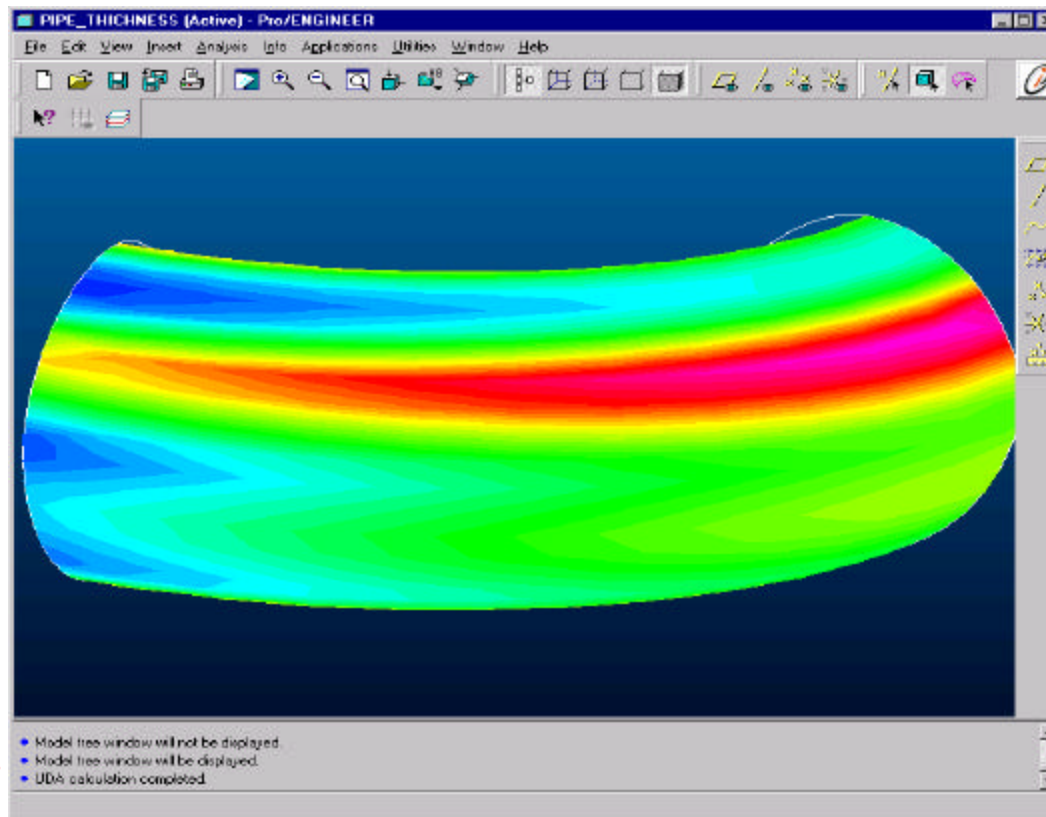

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Example # 3 Thickness Distribution

Inspect the cast pipe for minimum thickness requirement

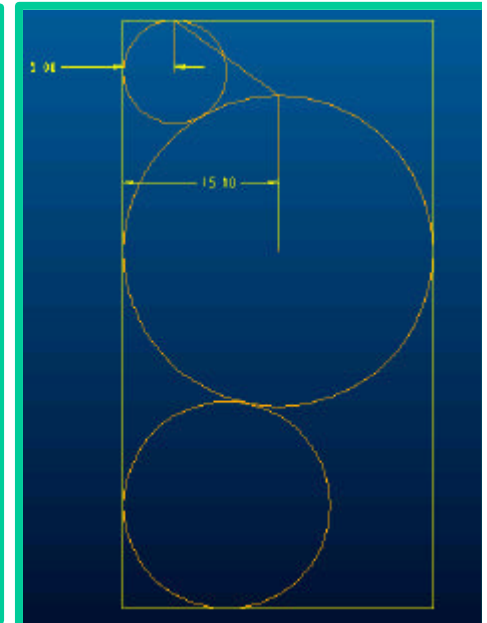

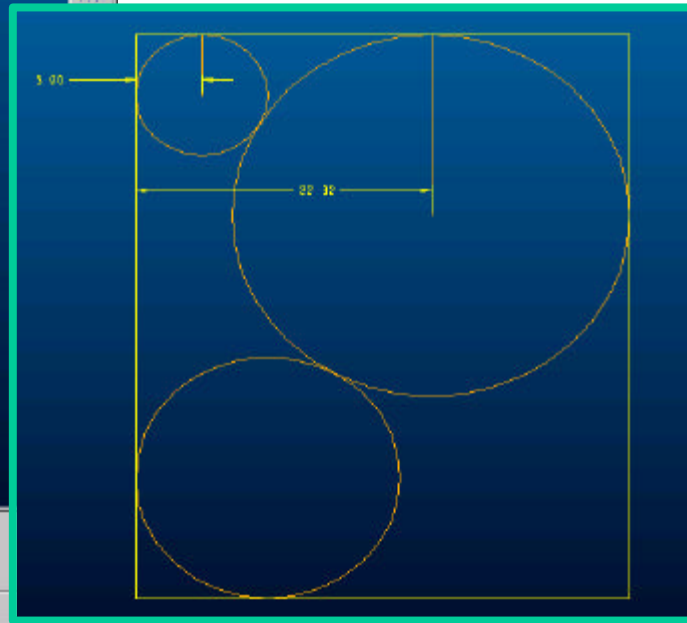

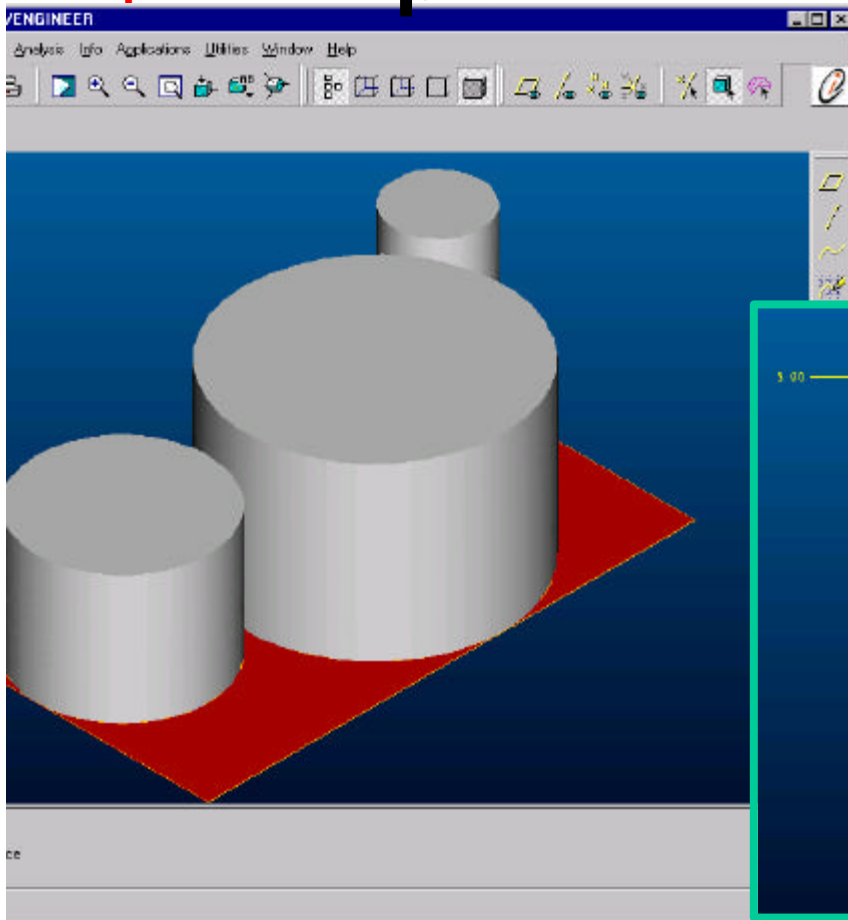

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Example # 4 Packaging Optimization

Arrange the objects such that the circumscribed rectangle has:

- minimum projected area
- minimum perimeter
- minimum container surface area

Example # 5 Robust container design

What values of D and H give the least variation (robust Design) in Volume V?

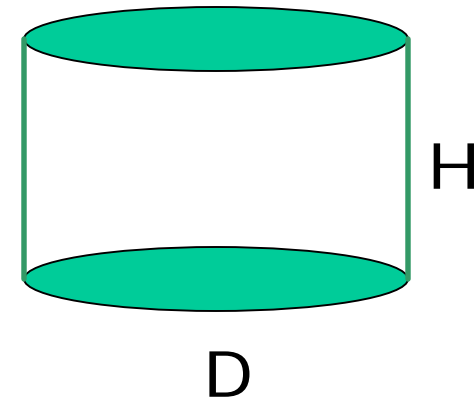

The desired volume is $V = 300$

The standard deviation in H and D is 0.5

$3 < D < 10$

$7 < H < 14$

Using Behavioral Modeling Build a part that automatically selects D, H to produce a design with the desired volume and the least volume variation (robust design)

Traditional Solution A: Derivative Optimization

$$V(H, D) = \pi D^2 H / 4$$

$$\sigma_H = 0.5, \text{ \& } \sigma_D = 0.5$$

Volume variance approximation:

$$\sigma_v = (V_{,D})^2 (\sigma_D)^2 + (V_{,H})^2 (\sigma_H)^2$$

$$\sigma_v = (\pi D H / 2)^2 (\sigma_D)^2 + (\pi D^2 / 4)^2 (\sigma_H)^2$$

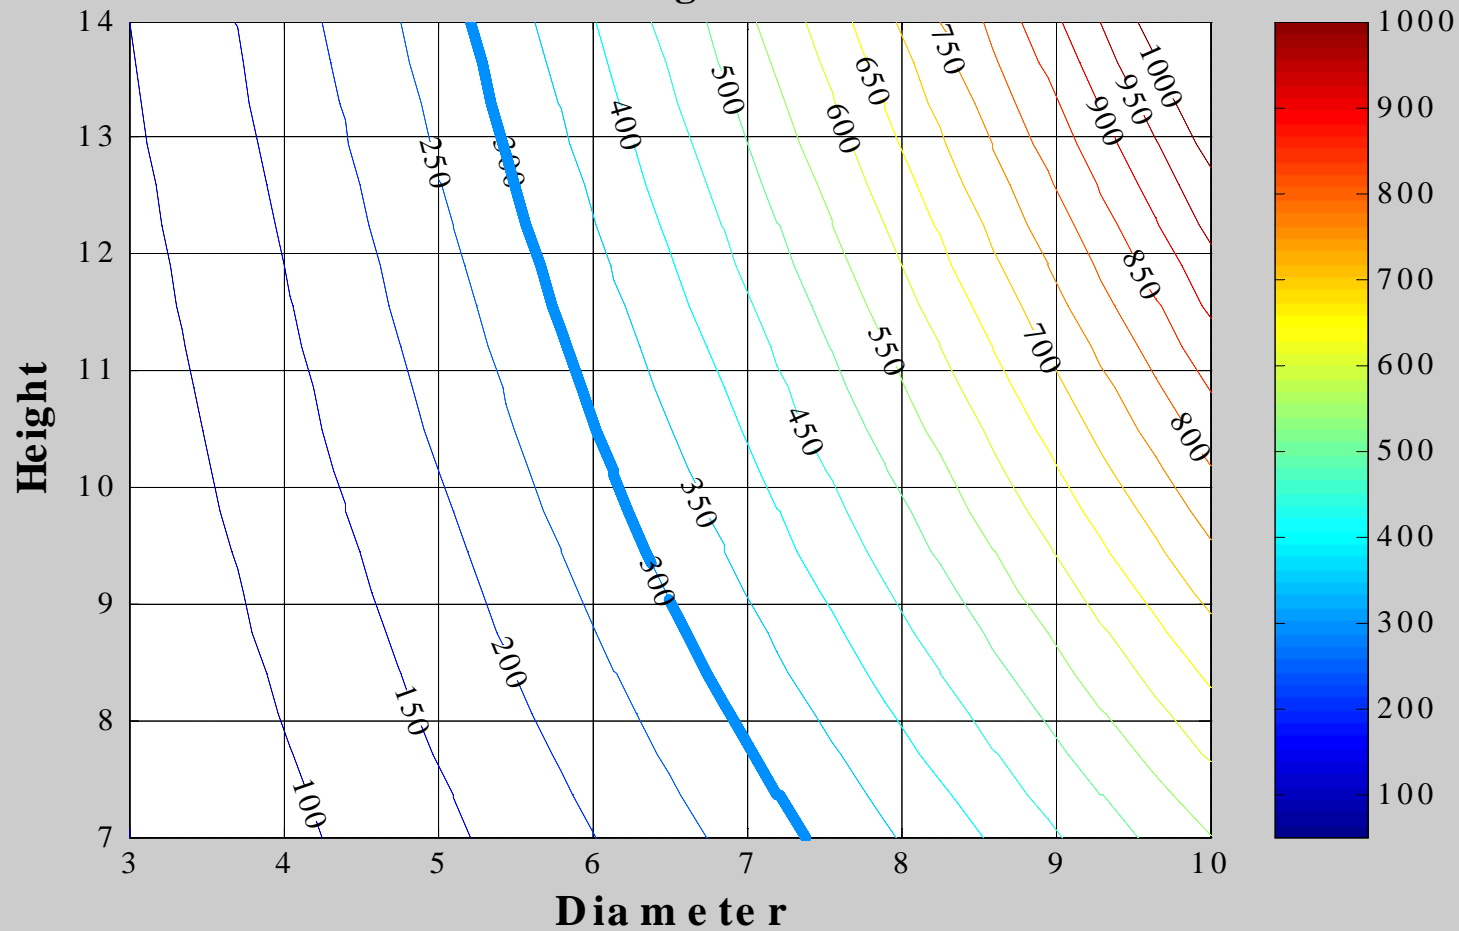

Optimization setup:

- Minimize σ_v
- Constraint $V=300$
- Design variables:
 - $3 < D < 10$
 - $7 < H < 14$

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

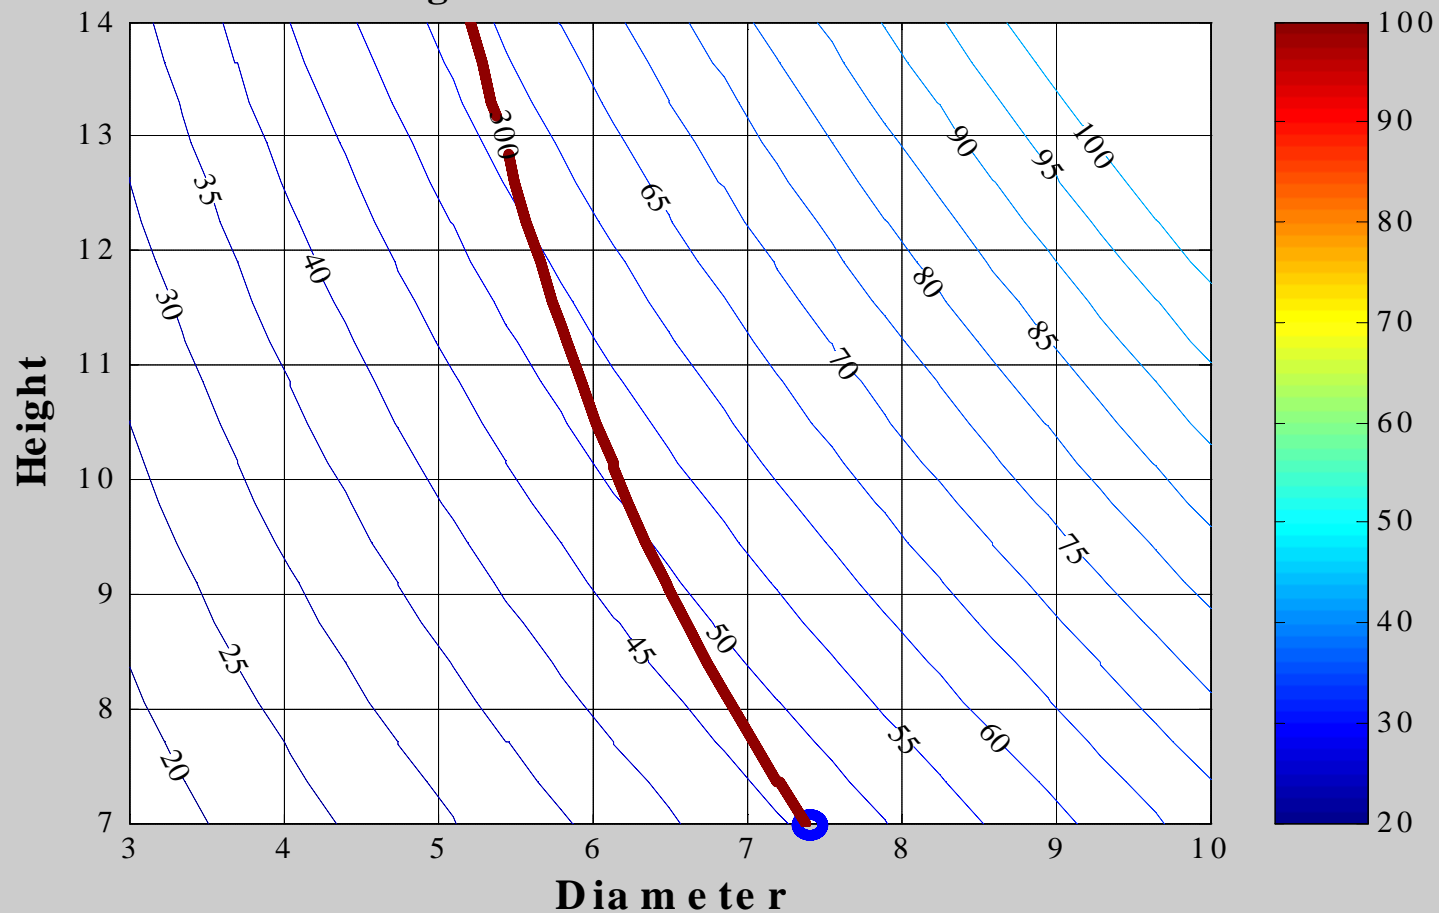

Robust Design - Volume

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Robust Design - Volume Standard Deviation

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Traditional Solution B: Monte Carlo Sampling

Generate sample points that have normal distribution with trial means i.e :

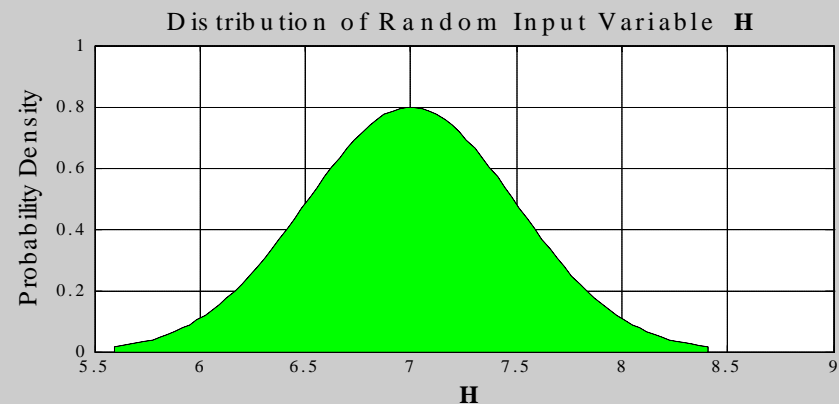

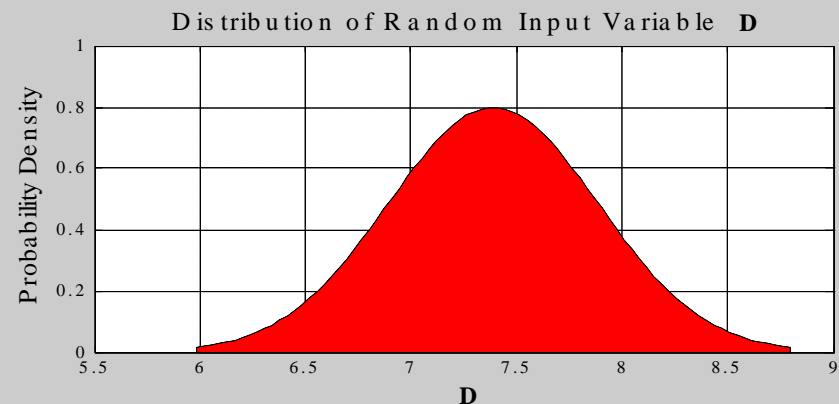

$$m_D = 7.39 \text{ \& } S_D = 0.5$$

$$m_H = 7.00 \text{ \& } S_H = 0.5$$

Use Monte Carlo direct or Latin Hyper-Cube Sampling techniques to generate pairs of D, H

Compute Volumes

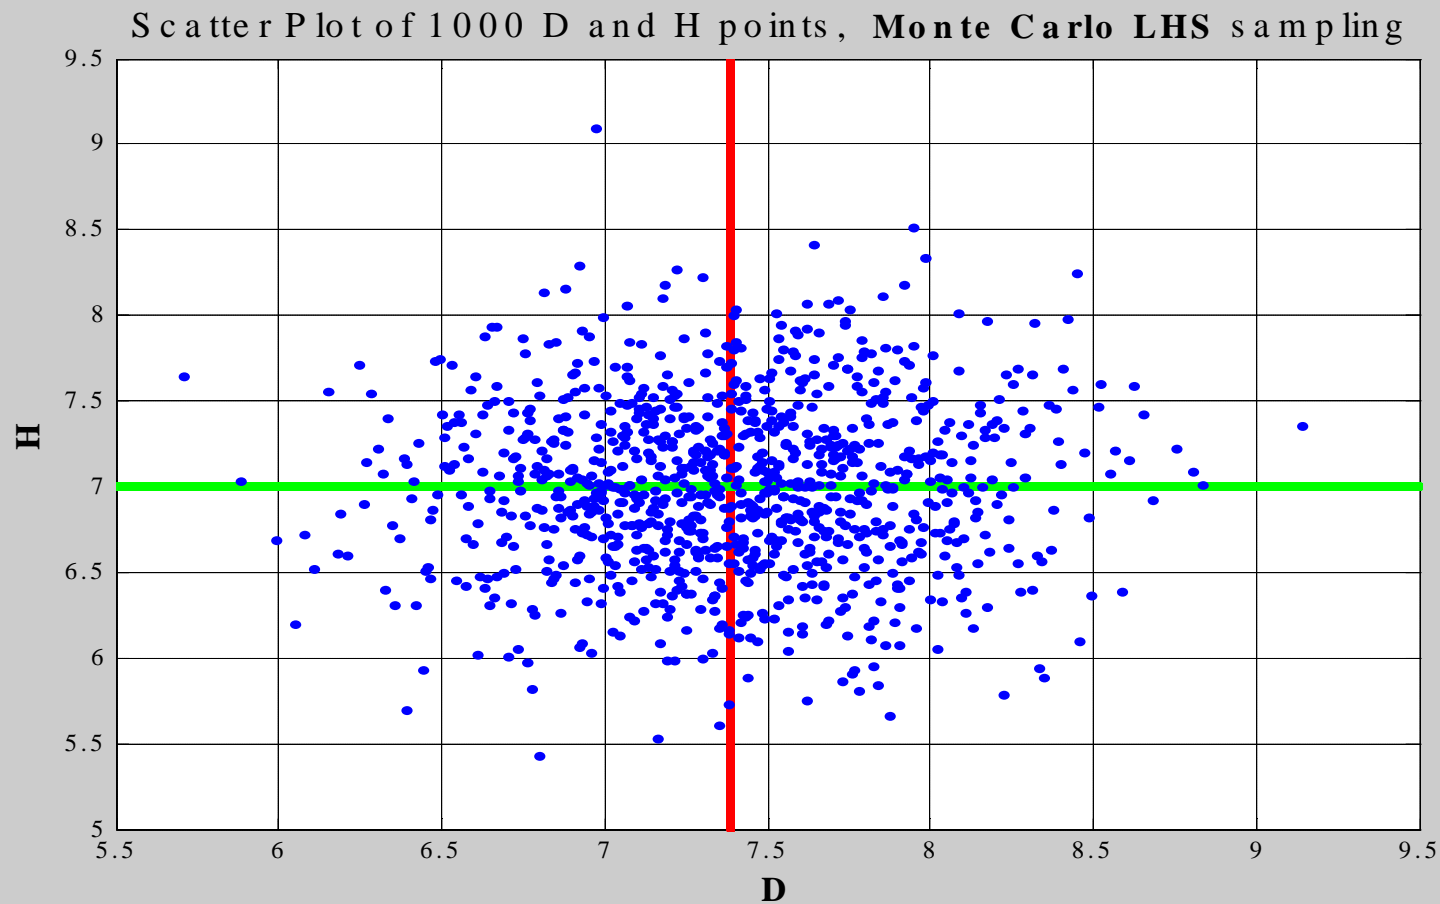

Compute Standard deviation

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Scatter Plot of 1000 D and H points Monte Carlo LHS sampling

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Random Distribution of Volume

Solution that minimize σ_v :

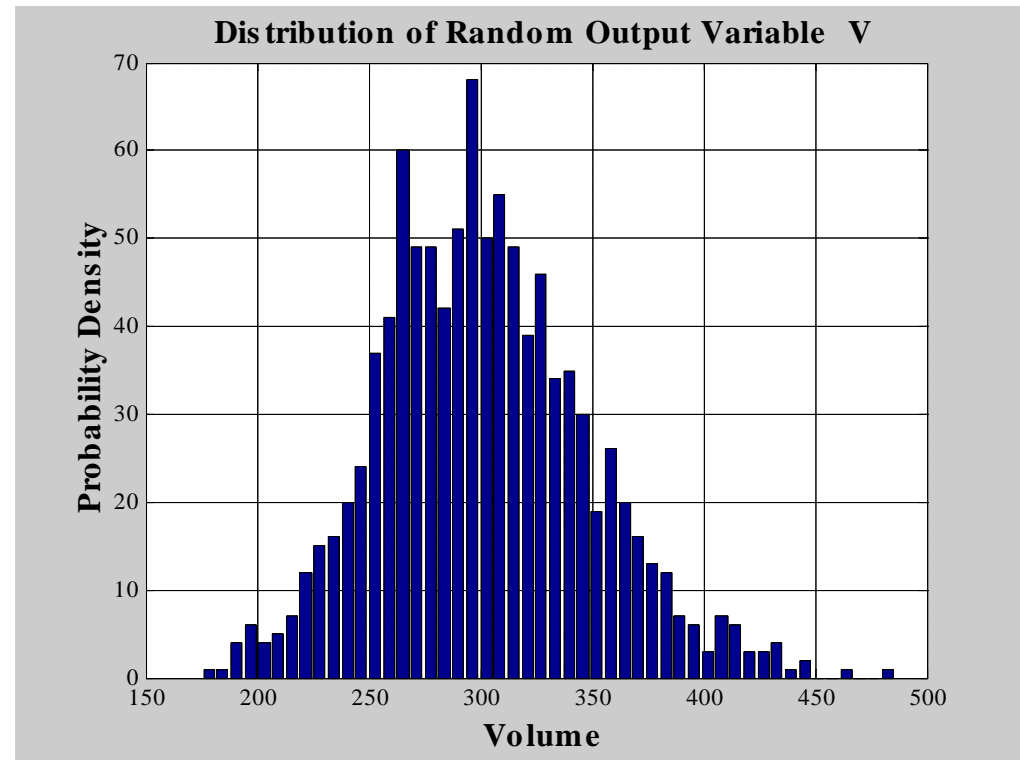

– $m_D = 7.39$

– $m_H = 7.00$

With

– $S_v = 46.87$

– $m_v = 300.1$

YES	STDV_FREQ1	PDS Paramet

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

When a Designer makes a change (i.e. hole diameter) the component thickness updates automatically to meet desired quality criteria and minimize weight

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Outline

- A status of the current design and simulation state in the product development process
- Overview of the tools and techniques for traditional and robust design (DOE, PDS, BMX, Six-sigma, design synthesis, etc)
- An overview of the “Engineering Quality into the Design”
- Implementation examples of Behavioral Modeling
- Overview of the implementation challenges and solution strategies to overcome them

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Why not realizing the expected gains from a CAD & CAE integration?

Technical challenges

- Design process remains unstructured or unplanned
- Insufficient number of experts for product design & attribute prediction
- Product attributes have not been formalized and managed early enough
- CAD / CAE toolset is not tailored to design environment
- Data not readily available to feed analysis

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Why not realizing the expected gains from a CAD & CAE integration?

Organizational challenges

- Lack of clear metrics and success stories
- Achieving consensus on methods to be used and on integration of product development environment with PDM software
- Developing and implementing custom capabilities with commercially available software (BMX, Visual DOC, iSIGHT, AI*workbench, CO,...)
- Organization's commitment to product development excellence

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Realizing The Expected Gains

1. Identify the right organization

- Committed to product development
- Willing to change
- Able to make decisions
- Willing to bypass consensus where needed

2. Identify the right project

- Repetitive and measurable
- High value added
- Bottle neck, short duration (3-6 months)
- Non trivial, expertise required
- Mainly with objective requirements

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

3. Solution Strategies

- Clarify and document the desired design decision process
- Establish the cost & time of the current state
- Create a design environment tailored to the desired design process; workflow management
- Develop a repository of design & manufacturing rules to govern the design process
- Augment the experts by automating large portions of the design process (BMX)
- Simplify and automate tool usage for standard analyses
- Improve attribute prediction as knowledge increases
- Automate data integration and allow for new methods

PTC/USER WORLD EVENT EUROPE, BERLIN 2002

Create a Vision,
Adopt it,
Adapt to Achieve it
